

# Servo design for the AEI-10m reference cavity

GEO-isc meeting

December 14, 2010

Fumiko Kawazoe

# Reference cavity---Optical Layout

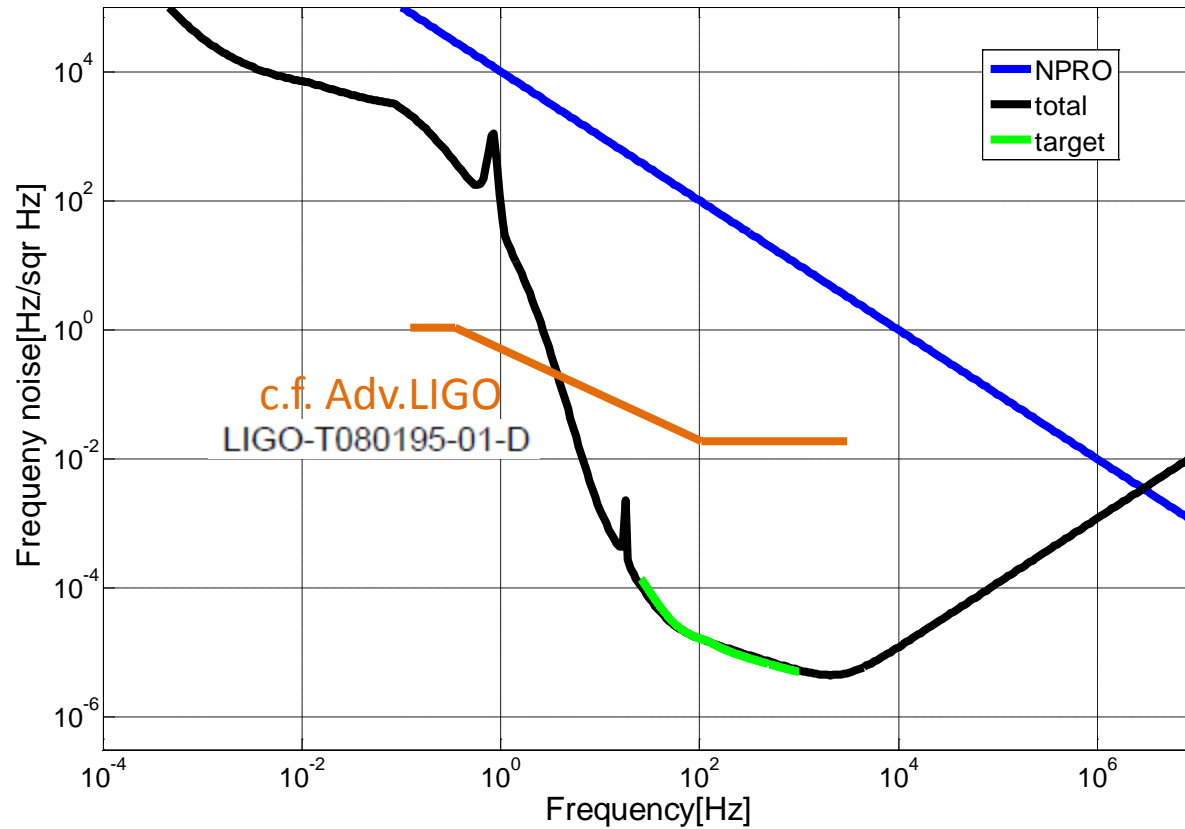

## Parameters

Round trip length	21.2 m
Finesse	7300
Input power	133 mW
ROC	37.5 m
g-factor	0.72
Waist size	2.40 mm
Mirror mass	850 g

# Frequency stabilization target

# Target gain

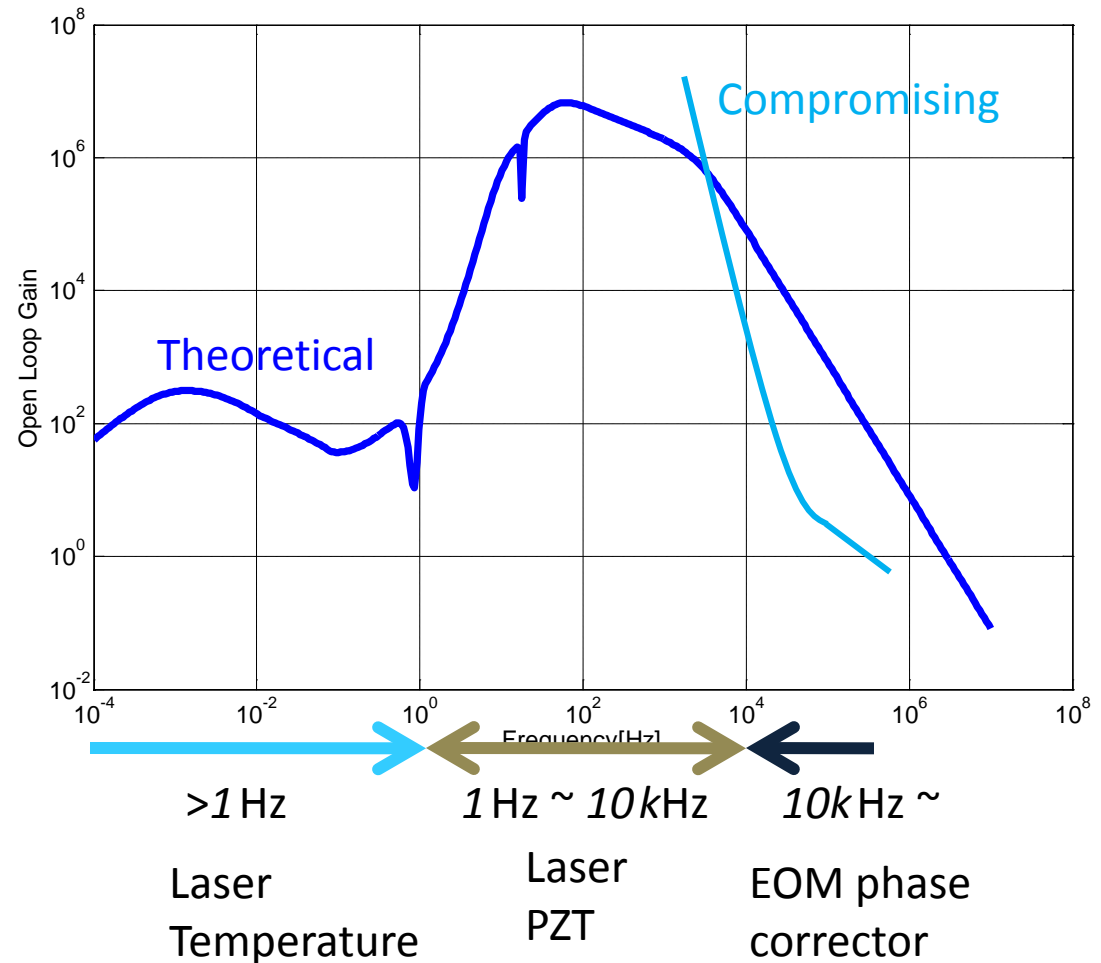

## Theoretical target

$f_{ug} = 1\text{MHz}$   
+  
40 deg. phase lag  
= impossible

Where  
Mixer lowpass filter,  
PD resonant circuit, etc.  
will be included.

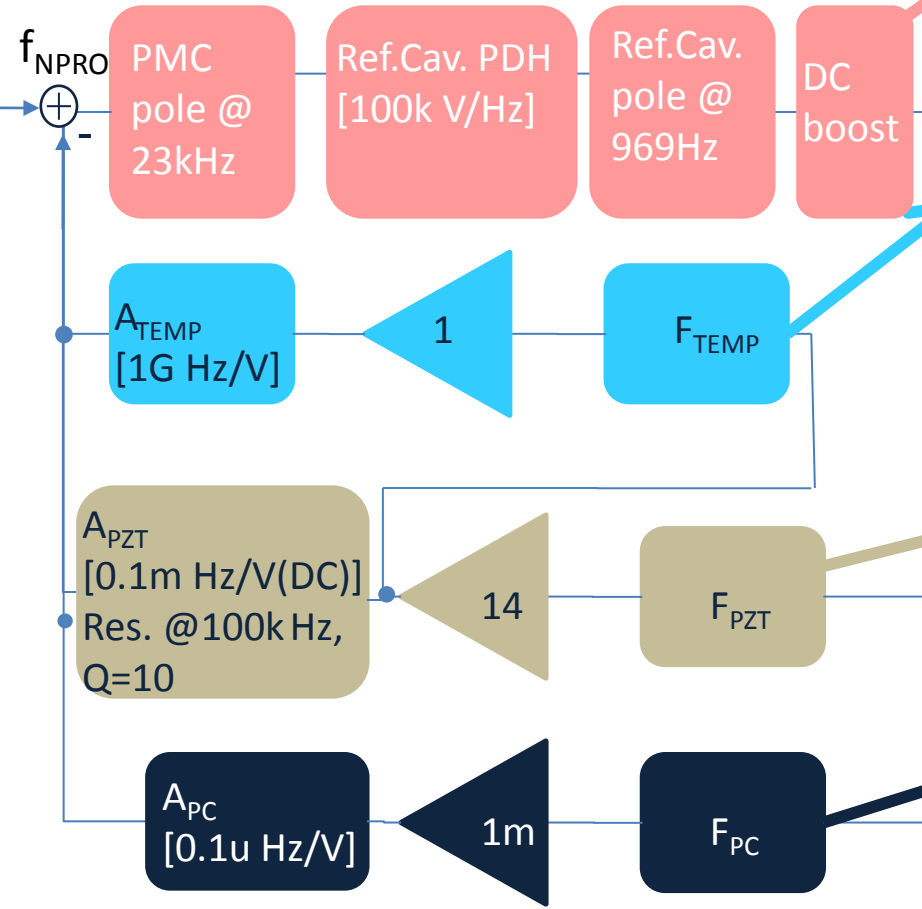

## Compromising target

$f_{ug} = 250\text{kHz}$

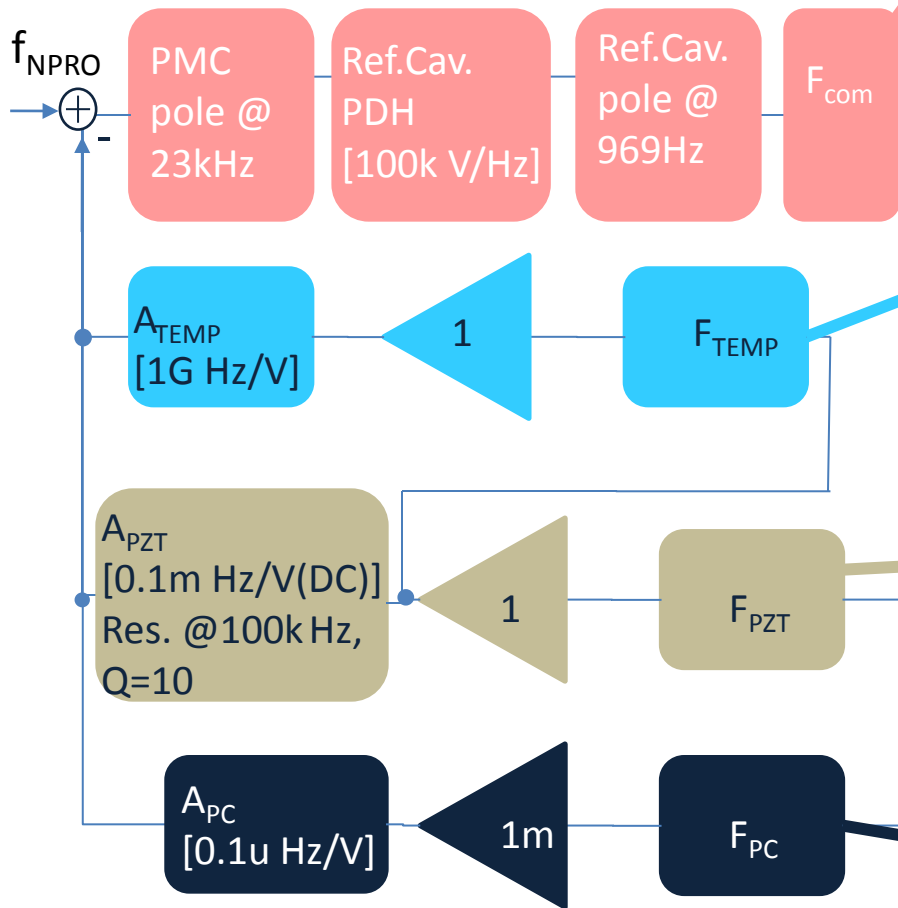

# Model 1 (many filters)

# Model 1 Overall gain

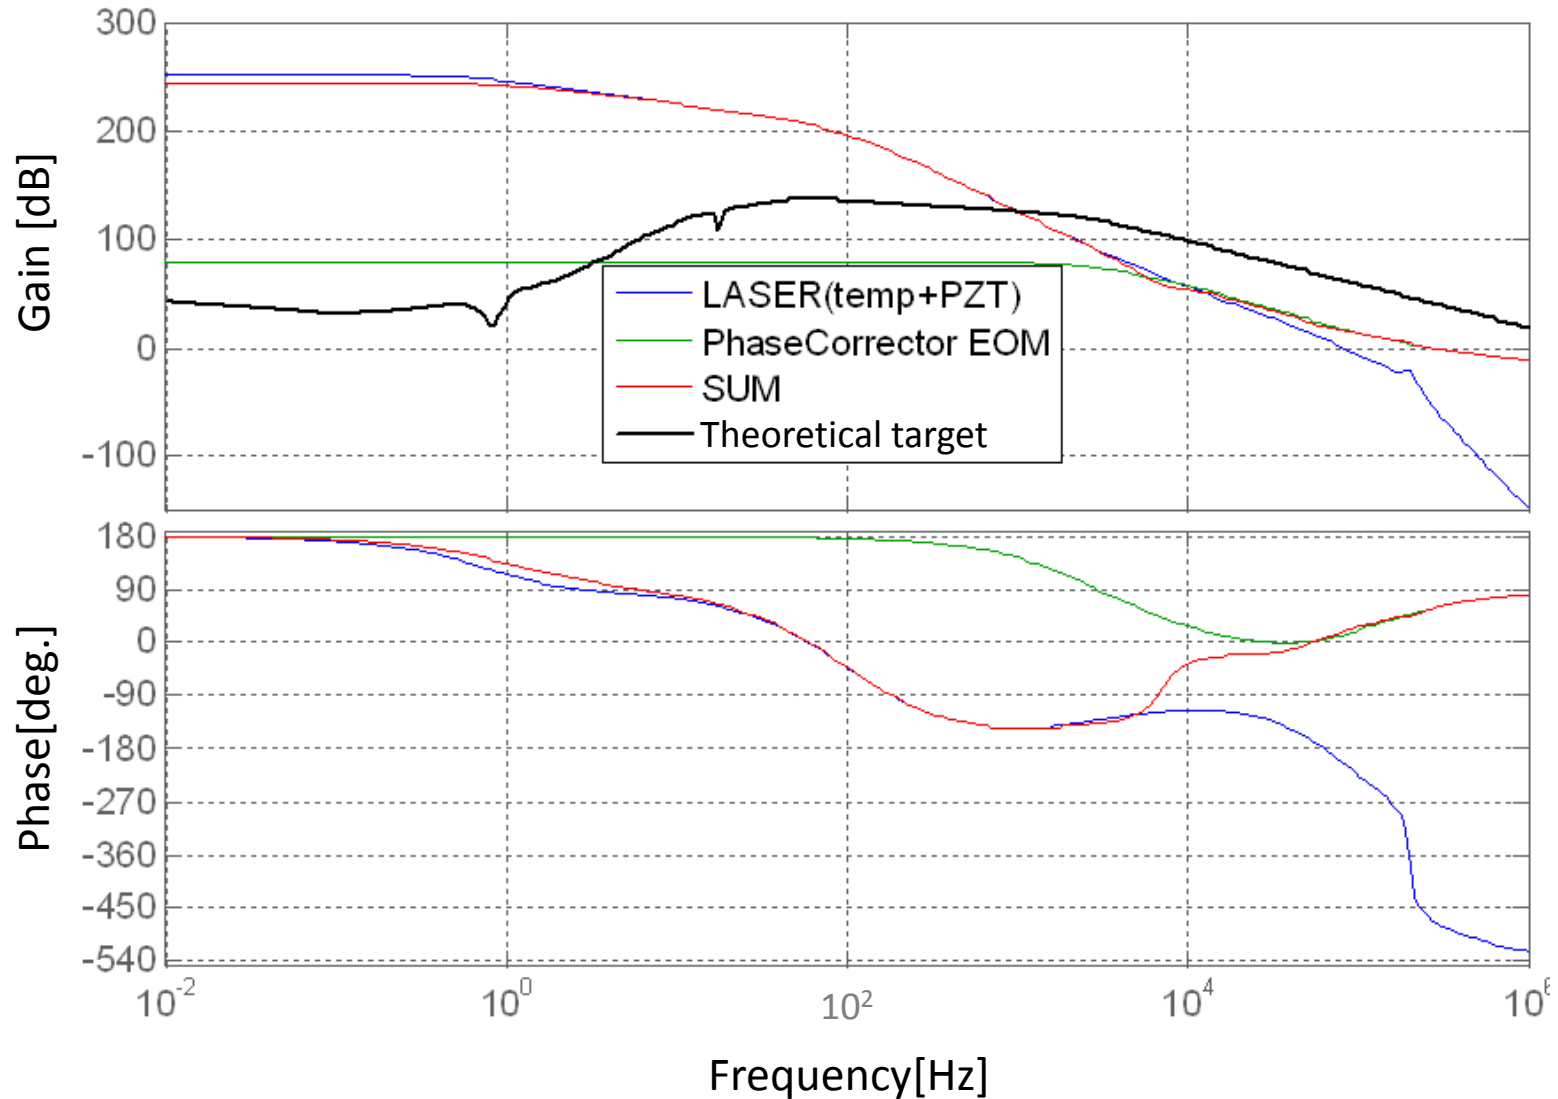

# Model 2 (less filters)

# Model 2 Overall gain

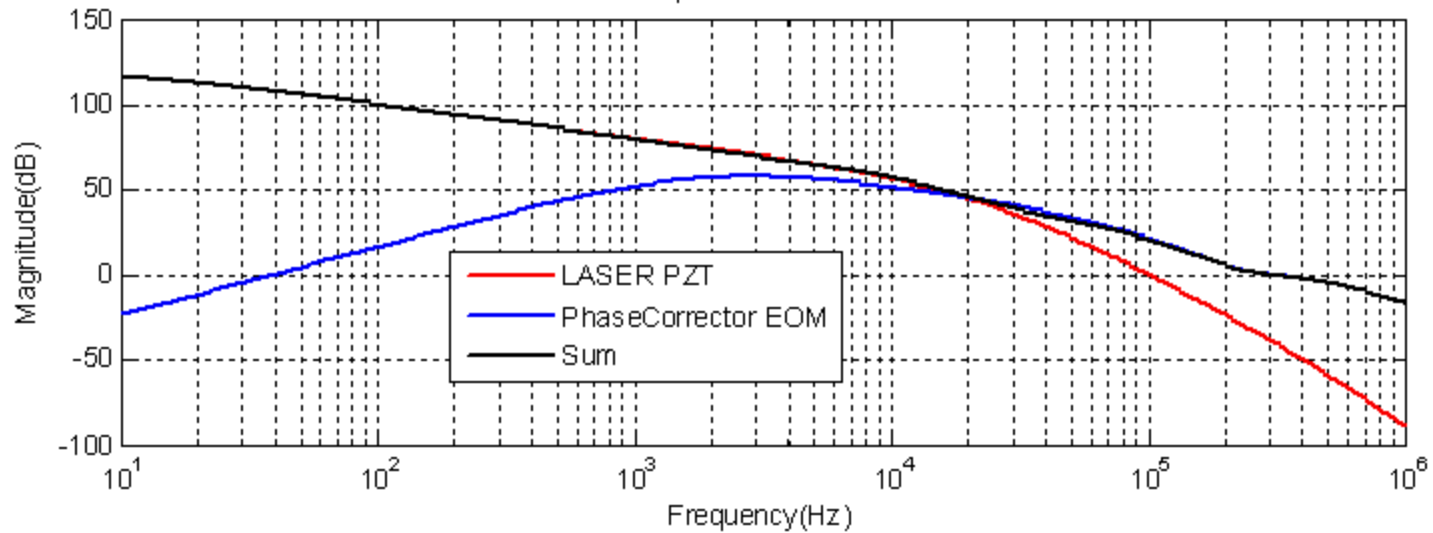

Bode Diagram  
More realistic model

# c.f. Adv.LIGO Overall gain

Example: Adv.LIGO servo

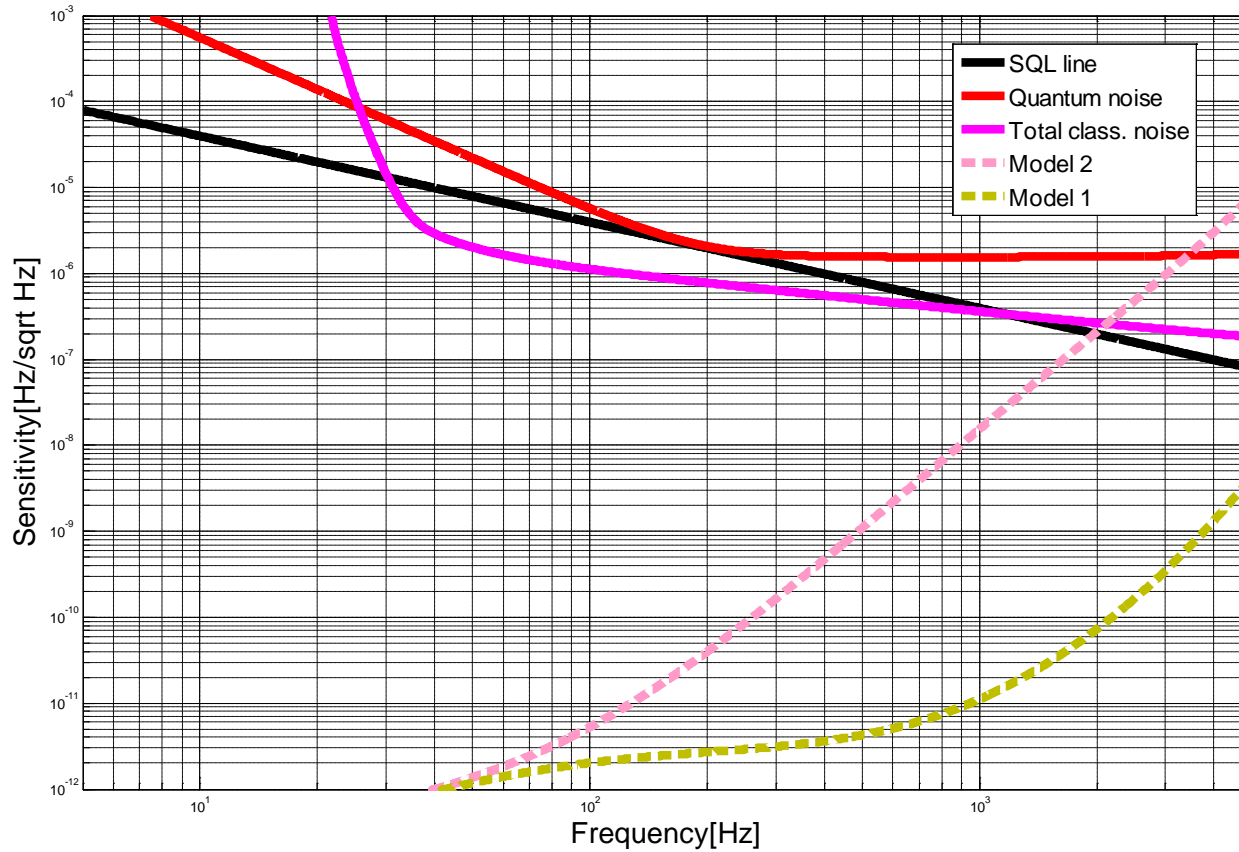

# Frequency noise level

Ref.cav. noise curves

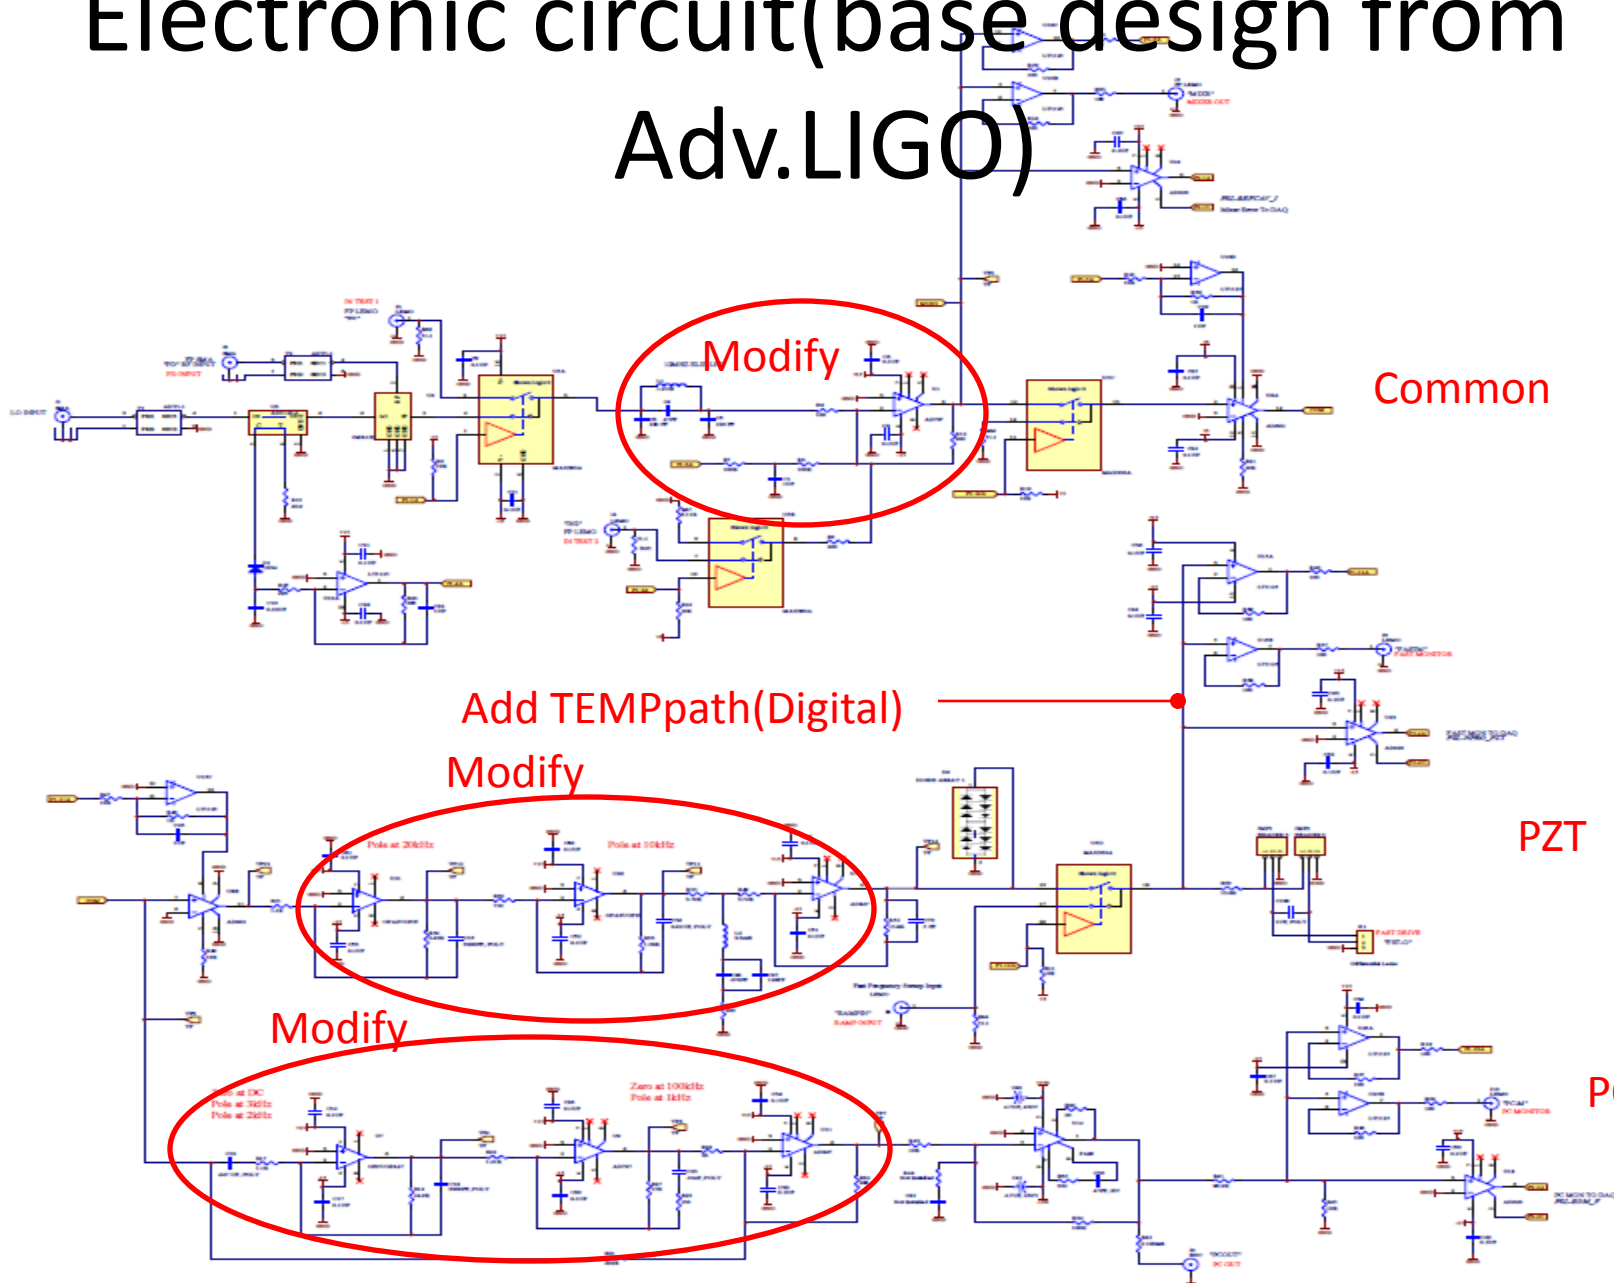

# Frequency noise on Sub-SQL output

Sub SQL IFO noise curves

# Electronic circuit(base design from Adv.LIGO)

Modify

Common

Add TEMPpath(Digital)

Modify

PZT

Modify

PC EOM

# Other requirements

- Optical signal gain drop  $< 25\%$  (so that it safely satisfy the stability condition) ...misalignment 800n [rad] (easy)
- Others...???

# Tasks not mentioned

- Finalize modulation frequency  
(Sub-SQL design dependent)
- EOM design (in Vacuum)
- Finalize locations  
(many other subsystem dependent)
